

# What is this?

This is a phoropter. Eye doctors called optometrists use it to measure how much trouble your eyes have in focusing light. It contains many lenses of varying strengths. The optometrist will ask you to look at an eye chart while he or she changes the lenses so that you can tell which one makes the eye chart clearest. With the help of a phoropter an optometrist can help you get the right lenses for your glasses or contacts.
